3: cpu_config.c

4: 蓝牙相关配置

01

芯片规格介绍

介绍AW30N芯片基本规格

一、芯片规格介绍

- ◆ AW30N芯片规格:
- ◆ 1、拥有单声道APA和AUDIO DAC;
- 2 HSB max 240MHz, LSB max 120MHz;
- 3、64K字节SRAM;

一、Memory内存介绍

◆ AW30N Memory 映射:

- ◆ 1、拥有64M字节的FLASH寻址空间;
- ◆ 2、拥有64K字节SRAM;
- ◆ 3、拥有16K字节ICACHE缓存空间;

一、不同芯片差异介绍

		杰理科技A	D系列芯	十主要差异		
芯片	AD14N	AD15N	AD17N	AD18N	AD16N	AW30N
CPU	32位	32位	32位	32位	32位	32位
最高运行时钟	192MHz	160MHz	160MHz	160MHz	160MHz	240MHz
cache最大flash寻址空间	32M字节	64M字节	64M字节	64M字节	64M字节	64M字节
RAM	32K	20K	14K	40K	40K	64K
Cache ram	16K	8K	4K	16K	16K	16K
AUDIO_ADC	MIC/AUX	无	无	无	MIC/AUX	MIC/AUX
AUDIO ADC采样率	8K~24K	无	无	无	8K~48K	8K~48K
CLASS-D直驱喇叭	支持	支持	支持	支持	无	支持
APA THD	-33dB	-33dB	-70+dB	-70+db	无	-72+dB
模拟AUDIO DAC	单声道	无	无	单声道	立体声	单声道
模拟AUDIO DAC SNR	83db	无	无	81 dB	>97db	>92dB
AUDIO DAC/APA采样率	8K~32K	8K~32K	32K~48K	AUDIO_DAC:8K~9 6K APA:32K~48K	8K~96K	AUDIO_DAC:8K~96K APA:32K~48K
gpio	25MAX	33MAX	22MAX	47MAX	33MAX	25MAX
io映射	2 out 4 input		1I/O Crossbar	I/O Crossbar	I/O Crossbar	I/O Crossbar
SDMMC	支持	支持	不支持	不支持	支持	支持
USB	支持	不支持	不支持	不支持	支持	支持

杰理科技AD系列芯片主要差异--软件

芯片	AD14N	AD15N	AD17N	AD18N	AD16N	AW30N
解码格式	MP3、WAV、F1A、 A、ump3、midi	F1A、A、midi	F1A、A、midi	MP3、WAV、F1A、 A、ump3、midi	MP3、WAV、F1A、 A、ump3、midi	MP3、WAV、F1A、 A、ump3、midi、 OPUS、SPEEX、ADPCM、 SBC、MSBC
压缩格式	MP3、WAV、A、 ump3				MP3、WAV、A、 ump3	MP3、WAV、A、 ump3、OPUS、SPEEX、 SBC、MSBC、ADPCM
扩展多种音频算法	支持	不支持	不支持	支持	支持	支持

一、RF相关性能指标介绍

/ 3. RF相关性能指标

3. RF相关性能指标

3.1. AUDIO BLE

AW30N BLE在发射功率为0dBm档位条件下,测到BLE灵敏度性能如下:

芯片BLE灵敏度	1Mbps	2Mbps	Long range(S2)	Long range(S8)
2402	-97dBm	-92dBm	-99dBm	-104dBm
2440	-97dBm	-94dBm	-98dBm	-104dBm
2448	-95dBm	-93dBm	-97dBm	-97dBm
2480	-97dBm	-94dBm	-99dBm	-104dBm

AW30N BLE在发射功率为0dBm档位条件下,测到BLE实际发射功率性能如下:

芯片BLE发射功率	1Mbps	2Mbps	Long range(S2)	Long range(S8)
2402	0.10dBm	0.07dBm	0.00dBm	0.00dBm
2440	0.40dBm	0.40dBm	0.36dBm	0.31dBm
2448	0.47dBm	0.48dBm	0.37dBm	0.34dBm
2480	0.42dBm	0.44dBm	0.32dBm	0.29dBm

一、RF蓝牙距离

测试场景		空旷场景(最大测试到60米)				
测试条件		面对面	背对背(单人遮挡)	背对背(双人遮挡)		
a 		a、轻微卡顿: 40m-55m b、卡顿严重: 60m c、断开连接: 无	a、轻微卡顿:30m-40m b、卡顿严重:40m-60m c、断开连接:无	a、轻微卡顿:30-40米 b、卡顿严重:40m-50m c、断开连接:55米		
		复杂场景(最	最大测试到35米)			
测试条件		面对面	背对背(单人遮挡)			
测试样机	A₩300开发板	a、轻微卡顿: 24m b、卡顿严重: 32-35m c、断开连接: 无	a、轻微卡顿: 16m b、卡顿严重: 16m-35m c、断开连接: 无			

BLE音频传输框架与流程

发送接收流程

二、SDK BLE应用音频传输框架与流程-两种GATT服务(完整GATT)

完整GATT服务,在SDK中其收发接口通过vble_complete来进行管理,详细见vble_complete.c

◆ GATT_complete特点:

- ◆ 1、基于标准GATT协议,具有完整GATT profile
- ◆ 2、从机支持HOGP协议,可连接手机或者其他主机设备
- ◆ 3、支持私有协议,支持修改广播包内容以及参数
- ◆ 4、支持多个att_handle收发数据,相关配置由profile决定
- ◆ 5、不支持主从切换

◆ 涉及文件:

- vble_complete.c
- ble_hogp.c
- ble_hogp_profile.h

二、SDK BLE应用音频传输框架与流程-两种GATT服务(简易GATT)

简易GATT服务,在SDK中其收发接口通过vble_simple来进行管理,详细见vble_simple.c

- ◆ GATT_simple特点:
- ◆ 1、具有简易的GATT profile
- ◆ 2、仅支持简单数据收发
- ◆ 3、使用固定att_handle通道进行收发数据
- ◆ 4、支持主从切换,主机可切换至从机进行蓝牙升级
- ◆ 5、支持私有连接间隔配置(支持大于3000us的任意间隔)

- ◆ 涉及文件:
- vble_simple.c
- ble_master.c
- ble_slave.c

二、SDK BLE音频传输框架与流程-音频数据传输框架

二、SDK BLE音频传输框架与流程-音频数据传输流程(发送端)

二、SDK BLE音频传输框架与流程-音频数据传输流程(接收端)

二、SDK BLE音频传输框架与流程-数据打包(packet)流程(发送端)

二、SDK BLE音频传输框架与流程-数据拆包(unpacket)流程(接收端)

蓝牙发送数据能力有限,因此发送端压入蓝牙buf的数据包可能不完整,且接收端收到的数据会有多个数据包

二、SDK BLE音频传输框架与流程-数据拆包(unpacket)流程(接收端)

二、SDK BLE音频传输框架与流程-数据拆包(unpacket状态机)流程(接收端)

03

SDK应用框架说明

介绍各个应用框架流程

三、玩具应用

- ◆ 玩具应用流程
- ◆ 即音乐、录音、扩音、midi、

AUX, RTC模式的统称

- ◆ 主要涉及文件:
 - app_modules.h
 - main.c
 - app.c
 - inita_app.c

```
#if (0 == RF REMOTECONTROL MODE EN)
  u32 get_up_suc_flag();
  void mbox flash main(void)
      log_info("Mbox-Flash App\n");
      if (get_up_suc_flag()) {
    log_info("----device update end----\n");
           wdt close();
           while (1):
      vm isr response index register(IRQ TICKTMR IDX);//vm擦写flash时响应tick
      delay 10ms(50);//等待系统稳定
      pa mute(0);
  #if 1//volume memory
      u8 \text{ vol} = 0:
      u32 res = sysmem_read_api(SYSMEM_INDEX_VOL, &vol, sizeof(vol));
if ((vol <= 31) && (res == sizeof(vol))) {
           dac vol(0, vol);
           log info("powerup set vol : %d\n", vol);
  #endif
      sysmem read api(SYSMEM INDEX SYSMODE, &work mode, sizeof(work mode));
         work mode = MUSIC MODE; */
       /* work mode = RECORD MODE; */
      /* work_mode = AUX_MODE; */
                                                      统称玩具应用模式
       /* work mode = MIDI KEYBOARD MODE; */
       /* work_mode = SIMPLE_DEC_MODE; */
     /* work_mode = LOUDSPEAKER_MODE; */
/* work_mode = RTC_MODE; */
      /* work_mode = RF_RAD10_MODE; */
while (1) {
           clear_all_message();
//切换模式前做预擦除动作
           sysmem_pre_erase_api();
           switch (work mode) {
  #if MUSIC MODE EN
           case MUSIC MODE:
               log info("-Music Mode\n");
               music app();
                                                                 c utf-8[unix]
                           <ps/app/src/mbox flash app.c</pre>
NORMAL
```

三、对讲机应用

- ◆ 对讲机应用
- ◆ 主要涉及文件:
 - app_modules.h
 - rf_radio_app.c
 - rf_radio_receive.c
 - rf_radio_send.c

> 对讲机应用框架

三、遥控器从机应用

- ◆ 遥控器应用
- ◆ 主要涉及文件:
 - app_modules.h
 - rc_app.c

三、遥控器从机应用

三、遥控器dongle主机应用

- ◆ 遥控器dongle应用
- ◆ 主要涉及文件:
 - app_modules.h
 - dongle.c

三、遥控器dongle主机应用

04

SDK应用配置说明

介绍各个配置文件,以及其中配置作用

- ◆ app_modules.h 部分配置说明
- ◆ (详情请看SDK文档)
- ◆ 1、应用模式选择
- ◆ 2、解码格式功能开关
- ◆ 3、音效算法功能开关
- ◆ 4、应用模式开关
- ◆ 5、升级开关

```

四、SDK应用配置说明 - 蓝牙发射功率配置说明

/ 2. 蓝牙硬件相关配置

2. 蓝牙硬件相关配置

2.1. 蓝牙发射功率

发射功率由函数void bt max pwr set(u8 pwr, u8 pg pwr, u8 iq pwr, u8 ble pwr)的参数ble pwr配置;

其中, 发射功率档位对应功率如下表:

支持的发射功率档位	对应的发射功率
0	-24dBm档位
1	-16dBm档位
2	-12dBm档位
3	-8dBm档位
4	-4dBm档位
5 (默认值)	+0dBm档位
6	+6dBm档位

目前可支持档位

暂不支持
